## Done in Lecture (week 1 - week 3)

- Polynomials
- III-conditioning
- Lagrange
- Newton

# **Polynomial Interpolation**

$$f(x) = a_1 x^n + a_2 x^{n-1} + \dots + a_{n+1}$$

n points  $\rightarrow$  n-1 = min order of the polynomial

Exercice 1 - Can you find the polynomial function that goes though these 3 points?

b)

**Exercice 1bis** - Polynomial function ?

## **Exercice 1 - Solution**

a) 
$$f(x) = -4x^2 + 8x$$

$$b) f(x) = -x + 2$$

1bis) 
$$f(x) = -x^2 + 35x - 250$$

## **Lagrange Interpolation**

$$P_2(x) = y_0 L_0(x) + y_1 L_1(x) + y_2 L_2(x)$$

$$L_0(x) = \frac{(x - x_1)(x - x_2)}{(x_0 - x_1)(x_0 - x_2)}$$

$$L_1(x) = \frac{(x - x_0)(x - x_2)}{(x_1 - x_0)(x_1 - x_2)}$$

$$L_2(x) = \frac{(x - x_0)(x - x_1)}{(x_2 - x_0)(x_2 - x_1)}$$

**Exercice 2** - Construct  $P_2(x)$  from the data points

a) 
$$(0, -1)$$
;  $(1, -1)$ ;  $(2, 7)$ .

**Exercice 2bis** - Use the Lagrange Polynomial to find the unique polynomial of degree 3 that agrees with the following data:

#### **Exercice 2 solution**

$$P_2(x) = (-1)^{\frac{(x-1)(x-2)}{2}} + (-1)^{\frac{(x)(x-2)}{-1}} + 7^{\frac{x(x-1)}{2}} = \frac{-1}{2}(x-1)(x-2) + x(x-2) + \frac{7}{2}x(x-1)$$

#### **Exercice 2bis guided solution**

We must have

$$p_3(-1) = 3$$

$$p_3(-1) = 3$$
  $p_3(0) = -4$   $p_3(2) = -6$ 

$$p_3(2) = -6$$

We construct the Lagrange polynomials  $\{\mathcal{L}_{3,j}(x)\}_{j=0}^3$ 

$$\mathcal{L}_{n,j}(x) = \prod_{i=0, i \neq j}^{3} \frac{x - x_i}{x_j - x_i}$$

This yields

$$\mathcal{L}_{3,0}(x) = \frac{(x - x_1)(x - x_2)(x - x_3)}{(x_0 - x_1)(x_0 - x_2)(x_0 - x_3)} = \frac{(x - 0)(x - 1)(x - 2)}{(-1 - 0)(-1 - 1)(-1 - 2)} = \frac{x(x^2 - 3x + 2)}{(-1)(-2)(-3)} = \frac{-1}{6}(x^3 - 3x^2 + 2x)$$

$$\mathcal{L}_{3,1}(x) = \frac{(x - x_0)(x - x_2)(x - x_3)}{(x_1 - x_0)(x_1 - x_2)(x_1 - x_3)} = \frac{(x + 1)(x - 1)(x - 2)}{(0 + 1)(0 - 1)(0 - 2)} = \frac{(x^2 - 1)(x - 2)}{(1)(-1)(-2)} = \frac{1}{2}(x^3 - 2x^2 - x + 2)$$

$$\mathcal{L}_{3,2}(x) = \frac{(x-x_0)(x-x_1)(x-x_3)}{(x_2-x_0)(x_2-x_1)(x_2-x_3)} = \frac{(x+1)(x-0)(x-2)}{(1+1)(1-0)(1-2)} = \frac{x(x^2-x-2)}{(2)(1)(-1)} = \frac{-1}{2}(x^3-x^2-2x)$$

$$\mathcal{L}_{3,3}(x) = \frac{(x - x_0)(x - x_1)(x - x_2)}{(x_3 - x_0)(x_3 - x_1)(x_3 - x_2)} = \frac{(x + 1)(x - 0)(x - 1)}{(2 + 1)(2 - 0)(2 - 1)} = \frac{x(x^2 - 1)}{(3)(2)(1)} = \frac{1}{6}(x^3 - x)$$

By substituting  $x_i$  for x in each Lagrange polynomial  $\mathcal{L}_{3,j}(x)$ , for j=0,1,2,3, it can be verified that  $\mathcal{L}_{3,j}(x_i)=0$  for  $i\neq j$ It follows that the Lagrange interpolating polynomial  $p_3(x)$  is given by :

# **Newton Interpolation**

2nd order

$$P_2(x) = a_1 + a_2(x - x_1) + a_3(x - x_1)(x - x_2)$$

$$a_1 = y_1$$

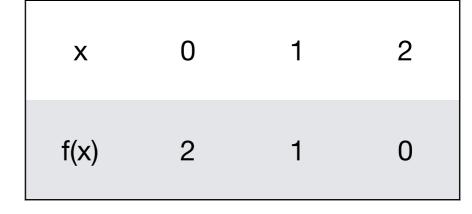

$$a_2 = \frac{y_2 - y_1}{x_2 - x_1}$$

$$a_3 = \frac{\frac{y_3 - y_2}{x_3 - x_2} - \frac{y_2 - y_1}{x_2 - x_1}}{x_3 - x_1}$$

**Exercice 3**- Construct  $P_2(x)$  from the data points

8

| a) | ×    | 0 | 1 | 2 |
|----|------|---|---|---|
|    | f(x) | 0 | 4 | 0 |

## **Exercice 3 solution**

a) 
$$P_2(x) = 4x - 4x(x - 1)$$

b) 
$$P_2(x) = 2 - x$$

#### **Exercice 3bis**

The data

a) Write the cubic interpolating polynomial in the Newton form:

$$p_3(x) = c_0(x-1) + c_1x(x-2)(x-3) + c_2x(x-1)(x-3) + c_3x(x-1)(x-2)$$

- b) Use the Lagrange Polynomial to find the unique polynomial of degree 3.
- c) Verify that solutions in (a) and (b) are the same.

## **Exercice 3bis solution**
